## Depot Management

Depot Management provides a completely integrated, sophisticated scheduling, tracking and reporting solution for depot repair facilities to efficiently manage internal depot work through the repair process. This offering provides a fully integrated solution for managing financial, logistics, manufacturing, human resources and service management business functions.

With the ability to support unlimited depot facilities, Depot Management integrates directly with Inventory and Returns Management applications to enable users to forecast predefined parts for accurate inventory planning and the ability to leverage on-floor bar coding for accurate cost tracking of parts, time and labor. Because Depot Management works tightly with the Returns Management application, one RMA (return material authorization) number is maintained throughout the entire depot repair process for efficient tracking and reporting capabilities.

Depot Management also offers a sophisticated, secure scheduling system that allows users to immediately reprioritize work orders as well as the ability to establish committed dates, thereby eliminating 'first-come, first-serve' depot repair facility methodology.

## Quick Features List

- Work orders can be entered and automatically scheduled through the workbenches or stations in your internal repair facility.
- Depot technicians can quickly record parts and labor usage during the repair process, including requesting backordered parts if needed.
- Repair costs can be rolled into items cost or expensed.
